

## Source

Biotinylated Monoclonal Anti-SN38 Antibody, Mouse IgG1, is produced from a hybridoma resulting from fusion of SP2/0 myeloma and B-lymphocytes obtained from a mouse immunized with SN38.

## Isotype

Mouse IgG1/kappa

## Specificity

Specifically recognizes the target-SN38.

## Application

PK, PD, Immunoassay and ELISA

## Purity

>90% as determined by SDS-PAGE.

## Endotoxin

Less than 1.0 EU per  $\mu\text{g}$  by the LAL method.

## Formulation

Lyophilized from 0.22  $\mu\text{m}$  filtered solution in PBS, pH7.4 with trehalose as protectant.

Contact us for customized product form or formulation.

## Reconstitution

Please see Certificate of Analysis for specific instructions.

*For best performance, we strongly recommend you to follow the reconstitution protocol provided in the CoA.*

## Storage

For long term storage, the product should be stored at lyophilized state at  $-20^{\circ}\text{C}$  or lower.

*Please avoid repeated freeze-thaw cycles.*

This product is stable after storage at:

- $-20^{\circ}\text{C}$  to  $-70^{\circ}\text{C}$  for 12 months in lyophilized state;
- $-70^{\circ}\text{C}$  for 3 months under sterile conditions after reconstitution.

## SDS-PAGE

Biotinylated Monoclonal Anti-SN38 Antibody, Mouse IgG1 on SDS-PAGE under reducing (R) condition. The gel was stained with Coomassie Blue. The purity of the protein is greater than 90% (With [Star Ribbon Pre-stained Protein Marker](#)).

## Biotinylated Monoclonal Anti-SN38 Antibody, Mouse IgG1 ELISA

0.2 µg of ADC-SN38 per well

Immobilized ADC-SN38 at 2 µg/mL (100 µL/well) can bind Biotinylated Monoclonal Anti-SN38 Antibody, Mouse IgG1 (Cat. No. SN8-BLS223) with a linear range of 0.49-7.81 ng/mL (QC tested).

## Background

SN-38 is an antineoplastic drug. It is the active metabolite of irinotecan (an analog of camptothecin - a topoisomerase I inhibitor) but has 1000 times more activity than irinotecan itself. In vitro cytotoxicity assays show that the potency of SN-38 relative to irinotecan varies from 2- to 2000-fold. SN38 is formed via hydrolysis of irinotecan by carboxylesterases and metabolized via glucuronidation by UGT1A1. The variant of UGT1A1 in ~10% of Caucasians which leads to poor metabolism of SN-38 predicts irinotecan toxicity, as it is then less easily excreted from the body in its SN-38 glucuronide form. SN-38 and its glucuronide are lost into the bile and intestines. It can cause the symptoms of diarrhoea and myelosuppression experienced by ~25% of the patients administered irinotecan.
